### **AMENDMENTS TO THE CLAIMS**

This listing of claims will replace all prior versions, and listings of claims in the application. Please amend the claims as follows without prejudice.

#### **Listing of Claims:**

1. (Original) A neutron measurement method for determining porosity of an earth formation surrounding a borehole comprising:
  - conveying a tool along said borehole, wherein said tool comprises a source of neutron radiation and at least one detector axially spaced from said source;
  - generating measured detector response for said at least one detector that is indicative of neutron radiation from said source interacting with said earth formations;
  - operating said measured detector response with a predetermined mathematical equation and thereby obtaining corrected detector response that is independent of the density of said earth formation; and
  - determining porosity of the earth formation surrounding the borehole from said corrected detector response.
2. (Original) The method according to claim 1, wherein said predetermined mathematical equation comprises multiplying the measured detector response by a correction factor that depends on the density of the formation.
3. (Currently Amended) The method of claim 2, wherein said at least one detector comprises a near detector and a far detector, wherein generating measured detector response comprises generating a measured near detector response and a measured far detector response, wherein obtaining corrected detector response comprises obtaining a corrected near detector response and a corrected far detector response, and wherein said measured and corrected near detector

Appl. No. 10/657,391  
Reply to Office Action Dated 04 January 2006

responses comprise a near detector count rate, said measured and corrected far detector responses comprise a far detector count rate.

4. (Currently Amended) The method according to claim 3, wherein said predetermined mathematical equation is of the form :  $CR_{corr} = CR \times e^{\beta \rho}$ ,

wherein  $CR_{corr}$  is the a corrected detector count rate,  $CR$  is the a measured detector count rate,  $\beta$  is the a detector sensitivity to density and  $\rho$  is the a formation density.

5. (Original) The method according to claim 4, wherein the detector sensitivity to density  $\beta$  can be adjusted in order to provide a corrected detector response that is independent of the borehole tool design.
6. (Original) The method of claim 1, wherein the source of neutron radiation is an isotopic source that emits fast neutrons.
7. (Currently Amended) The method of claim 1, wherein said at least one detector comprises a near detector and a far detector, said near and far detectors are being thermal neutron detectors.
8. (Currently Amended) The method of claim 1, wherein said at least one detector comprises a near detector and a far detector, said near and far detectors are being epithermal neutron detectors.
9. (Original) The method of claim 1, wherein said tool is conveyed by means of a drill string.
10. (Original) A neutron measurement method for determining porosity of an earth formation surrounding a borehole comprising:

- conveying a tool along said borehole, wherein said tool comprises a source of neutron radiation and at least two detectors axially spaced from said source at different spacings;
- generating measured detectors responses for each said at least two detectors that are indicative of neutron radiation from said source interacting with said earth formations;
- selecting from said at least two detectors a pair of detectors comprising a near detector and a far detector, said near detector being placed closer to said neutron radiation source than said far detector;

Appl. No. 10/657,391  
Reply to Office Action Dated 04 January 2006

- operating in said pair of near and far detectors at least one of the measured detector response with a predetermined mathematical equation and thereby obtaining corrected detector response that is independent of the density of said earth formation;
- forming a corrected ratio from said at least one corrected detector response and from said other detector response in said pair of near and far detectors; and
- determining porosity of the earth formation surrounding the borehole from said corrected ratio.

11. (Original) The method according to claim 10, wherein said predetermined mathematical equation comprises multiplying the measured detector response by a correction factor that depends of the density of the formation.
12. (Original) The method of claim 11, wherein said measured and corrected near detector responses comprise a near detector count rate, said measured and corrected far detector responses comprise a far detector count rate.
13. (Original) The method according to claim 12, wherein said mathematical equation is of the form :  $CR_{corr} = CR \times e^{\beta \rho}$  ,  
wherein  $CR_{corr}$  is the corrected detector count rate, CR is the measured detector count rate,  $\beta$  is the detector sensitivity to density and  $\rho$  is the formation density.
14. (Original) The method according to claim 13, wherein the detector sensitivity to density  $\beta$  can be adjusted in order to provide a corrected detector response that is independent of the borehole tool design.
15. (Original) The method of claim 10, wherein both the measured near detector response and the measured far detector response are operated with the predetermined mathematical equation.
16. (Original) The method of claim 10, wherein the source of neutron radiation is an isotopic source that emits fast neutrons.
17. (Original) The method of claim 10, wherein said near and far detectors are thermal neutron detectors.

18. (Original) The method of claim 10, wherein said near and far detectors are epithermal neutron detectors.
19. (Original) The method of claim 10, wherein said tool is conveyed by means of a drill string.
20. (Original) A system for determining porosity of an earth formation surrounding a borehole comprising:
- (a) a borehole tool comprising a source of neutron radiation and at least one detector; and
  - (b) a computer for computing measured response of said detector thereby obtaining a measure of the porosity of the earth formation surrounding the borehole, whereby:
    - said measured response from said at least one detector is indicative of nuclear radiation from said source interacting with said earth formation;
    - said measured response of said detector is operated with a predetermined mathematical equation using said computer to obtain corrected detector response that is independent of the density of the formation; said corrected detector response being indicative of the porosity of the earth formation surrounding the borehole.
21. (Original) A system according to claim 20, wherein said predetermined mathematical equation comprises multiplying the measured detector response by a correction factor that depends of the density of the formation.
22. (Currently Amended) A system according to claim 21, wherein said at least one detector comprises a near detector and a far detector, wherein said measured response comprises a measured near detector response and a measured far detector response, wherein said corrected detector response comprises a corrected near detector response and a corrected far detector response, and wherein said measured and corrected near detector responses comprise a near detector count rate, said measured and corrected far detector responses comprise a far detector count rate.
23. (Currently Amended) A system according to claim 22, wherein said predetermined mathematical equation is of the form:  $CR_{\text{corr}} = CR \times e^{\beta p}$ ,

Appl. No. 10/657,391  
Reply to Office Action Dated 04 January 2006

wherein  $CR_{\text{corr}}$  is ~~the~~ a corrected detector count rate,  $CR$  is ~~the~~ a measured detector count rate,  $\beta$  is ~~the~~ a detector sensitivity to density and  $\rho$  is ~~the~~ a formation density.

24. (Original) A system according to claim 23, wherein the detector sensitivity to density  $\beta$  can be adjusted in order to provide a corrected detector response that is independent of the borehole tool design.
25. (Original) A system according to claim 20, wherein the source of neutron radiation is an isotopic source that emits fast neutrons.
26. (Currently Amended) A system according to claim 20, wherein said at least one detector comprises a near detector and a far detector, said near and far detectors ~~are~~ being thermal neutron detectors.
27. (Currently Amended) A system according to claim 20, wherein said at least one detector comprises a near detector and a far detector, said near and far detectors ~~are~~ being epithermal neutron detectors.
28. (Original) A system according to claim 20, wherein said tool is conveyed by means of a drill string.
29. (Original) A system for determining porosity of an earth formation surrounding a borehole comprising:
- (a) a borehole tool comprising a source of neutron radiation and at least two detectors axially spaced from said source at different spacings, said detectors comprising a near detector and a far detector, said near detector being placed closer to said neutron radiation source than said far detector; and
  - (b) a computer for combining measured responses of said at least two detectors thereby obtaining a measure of the porosity of the earth formation surrounding the borehole, whereby:
    - said measured responses from said at least two detectors are indicative of nuclear radiation from said source interacting with said earth formation;

Appl. No. 10/657,391  
Reply to Office Action Dated 04 January 2006

- at least one of said measured responses of said detectors is operated with a predetermined mathematical equation using said computer to obtain corrected detector response that is independent of the density of the formation;

- said corrected detector response and other detector response in said pair of near and far detectors are combined using said computer to form a corrected ratio; and

- said corrected ratio is indicative of the porosity of the earth formation surrounding the borehole.

30. (Original) A system according to 29, wherein said measured and corrected near detector responses comprise a near detector count rate, said measured and corrected far detector responses comprise a far detector count rate.

31. (Original) A system according to claim 30, wherein said mathematical equation is of the form :  $CR_{corr} = CR \times e^{\beta \rho}$ ,

wherein  $CR_{corr}$  is the corrected detector count rate, CR is the measured detector count rate,  $\beta$  is the detector sensitivity to density and  $\rho$  is the formation density

32. (Original) A system according to claim 29, wherein both the measured near detector response and the measured far detector response are operated with the predetermined mathematical equation.

33. (Original) A system according to claim 29, wherein the source of neutron radiation is an isotopic source that emits fast neutrons.

34. (Original) A system according to claim 29, wherein said near and far detectors are epithermal neutron detectors.

35. (Original) A system according to claim 29, wherein said near and far detectors are thermal neutron detectors.

36. (Original) A system according to 29, wherein said tool is conveyed by means of a drill string.
